## **DETAILED ACTION**

This action is responsive to the communication filed on 11/16/2009.

### ***Response to Amendment***

1. Claim 17 has been cancelled and all claims have been amended for clarity.

Replacement drawing sheets have been submitted and hence the objection is withdrawn.

Based on the amendments and arguments, the 35 USC 112 rejections have been overcome.

### ***Allowable Subject Matter***

2. Claims 1-16 are allowed. The following is an examiner's statement of reasons for allowance:

Applicant's invention is novel in respect to the prior art listed and other time scaling for parametric encoded audio references as the invention is directed to an apparatus wherein parametric encoding data is applied to frequency sample blocks *of a time scaled signal*.

Regarding independent claim 1, which focuses on an apparatus for time scaling a signal, Prior Art Inoue (US 2001/0032072) represents the next closest prior art and teaches speed conversion of a multi channel signal (*Abstract, [0001-0002; 0050]*). Further, it discloses a *parametric encoding method can convert the speech speed by interpolating the encoding parameters in the process of decoding the acoustic signal [0050]*.

*Prior Art Chang 2003/0105539 – Time Scaling of Stereo Audio* also represents a standard method of time scaling for stereo audio ([0012], [0013], [0022]). It further discloses *the time scaling generates time-scaled frames corresponding to the same time interval using a common time offset that is the same for all channels, instead of performing completely independent time scaling processes on the separate channels* [0022].

Applicants' invention is novel in respect to the prior art in that the invention is directed to a system wherein parametric encoding data is applied to frequency sample blocks *of a time scaled signal*. For example, a stereo signal may be generated from a mono signal *by applying parameters of the extension data to frequency sample blocks of a time scaled signal*. Furthermore, the system uses a fixed time interval of the time scaled signal *rather than of the original signal as is typical in the prior art*. Thus, as the parameters of the parametric data relates to the time base of the original signal while the frequency sample blocks relate to the time base of the time scaled signal, these parameters are not used directly. Rather, the parameters are compensated for the time offsets between the time scaled signal and the original signal.

Applicants' invention is directed to the problem of reducing complexity and resource demand when performing time scaling for parameter based encoded signals. The subject invention's solution to this problem is firstly to use frequency conversion that is fixed relative to the time base of the time scaled signal *rather than the original input signal (as is the approach in the prior art)*. Specifically, the subject invention generates frequency sample blocks corresponding to a fixed time interval of the time scaled signal. Furthermore, the fixed time

interval is independent of a time scaling factor. However, this is a fundamental change which results in the frequency sample blocks no longer being synchronized or aligned with the time base of the input signal, and therefore no longer being synchronized with the parameters of the extension data. Accordingly, these parameters can no longer be used directly.

The subject invention solves this problem by first determining the time relationship between one parameter value and one frequency sample block. Based on the time relationship, a second parameter value is generated from the first parameter value for a second frequency sample value. This parameter value is then used to modify the data in the second frequency sample value. Thus, the processing provides a conversion between the different time bases and allows the frequency conversion to use a fixed number of samples, a fixed transform algorithm and fixed windowing. This may very substantially reduce the complexity and resource usage.

Independent claim 15, which focuses on a method for time scaling a signal, is allowed for similar rationale and reasoning as claim 1 above.

Therefore regarding independent claims 1 and 15 the prior art or combination thereof fails to disclose or make obvious the method and apparatus for time scaling a signal comprising the steps of:

receiving an input signal comprising a first signal and extension data associated with the first signal;  
generating a time scaled signal of the first signal;

means for generating a frequency sample blocks for the time scaled signal, each frequency sample block corresponding to a fixed time interval of the time scaled signal, the fixed time interval being independent of the time scaling factor;

determining a first time-association between a first parameter value of the extension data and a first frequency sample block having an associated first time interval of the time scaled signal;

determining a second parameter value associated with a second frequency sample block in response to the first time association and the first parameter value;

modifying data of the second frequency sample block in response to the second parameter value; and

generating time domain output sample blocks from the frequency sample blocks.

3. Claims 2-14 and 16 are therefore allowed due to their dependency on claims 1 and 15, which further limit the independent/parent claims.

4. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
